Title : Studies of the Suppressive Effects of Actinomycetes on
Actinophages.

Orig Pub : Mikrobiologiya, 1957, 26, No 6, 729-735

Abstract : Of 9 actinophages isolated from the soil only 2 were distinguished by specificity of action, while the others were polyvalent. Comparative studies of the antiphage and antibacterial activity of 1000 strains of Actinomycetes showed that of 546 strains which suppressed bacterial growth, 331 also suppressed actinophages (under conditions of interaction with a culture), and of 454 strains which did not suppress bacteria, 247 also suppressed actinophages. Of 578 cultures of Actinomycetes with

TITLE: Separation of ²⁷thorium from accompanying elements and production of analytical concentrates by the method of ion exchange chromatography

SOURCE: Zhurnal analiticheskoy khimii, v. 21, no. 1, 1966, 40-45

TOPIC TAGS: thorium, chemical separation, ion exchange chromatography, zirconium, cation

ABSTRACT: The article presents the results of experiments on the separation of thorium from many elements, and on the concentration of thorium from solutions containing from 2×10^{-2} to 1×10^{-2} micrograms/milliliter, using a type KU-2 cation exchange resin. Experiments were made under static conditions: 0.15 grams of KU-2 cation exchange resin in the hydrogen form (grain size 0.5-1.0 mm) were mixed with 15 milliliters of the solution to be analyzed up to the point at which equilibrium was established. The concentration of zirconium or thorium in the starting solutions was 1×10^{-3} molar. In the separation of

thorium from zirconium and other elements, 25 milliliters of a mixture of 5 N HClO₄ + 0.1 N H₂SO₄ containing about 10 milligrams of Th(IV), as well as Be(II), Fe(III), Cr(III), Ti(IV), Ge(IV), Sn(IV), V(V), Mo(VI), W(VI), or U(VI) was passed at a rate of 2-3 milliliters/min through a column filled with cation exchange resin KU-2 in the H-form (depth of the layer was 20 cm and the diameter 1 cm). Fractions of the eluate of about 25 ml were selected and from each of them the metal ions were determined by standard photometric methods. Results are exhibited in a series of curves and tables. The method described was used for the concentration of thorium from very dilute solutions of the order of 10⁻⁸ to 10⁻⁹ molar. The degree of concentration obtained was approximately 1000. Orig. art. has: 1 figure and 3 tables.

Metabolism of labile phosphorus compounds in brain anemia under conditions of protective inhibition. K. G. Gerasimova, I. R. Kudritskaya, I. R. Petrov, and V. S. Shaput (Inst. Exptl. Med., Leningrad). *Biokhimiya* 17, 13-20 (1953). Most of the white rats after ligation of the carotid arteries showed convulsions, and died within 1-12 days. The few without convulsions lived longer, up to 4 days. When the animals were placed in an atm. of 50% O₂ for 6 hrs., the no. of convulsive cases decreased. During anemia, especially in convulsive animals, a disturbance was observed in the resynthesis of adenosine triphosphate, because of O₂ starvation, which lowered oxidative phosphorylation. After a sleeping dose of urethan, the P metabolism of the anemic animals was practically normal. Cooling the animals to 30-31° for 2 hrs. previous to ligation of the carotid arteries prolonged the life of the animals and prevented a profound disturbance in the metabolism of labile P compounds. KUDRITSKA, T.E.

2840. THE INFLUENCE OF HYPOTHERMIA AND GANGLIOPLEGIC DRUGS ON THE BRAIN PHOSPHORUS AND CARBOHYDRATE METABOLISM IN ANIMALS WITH TEMPORARY EXCLUDED HEART CORONARY CIRCULATION (Russian text) - Raiko Z. A., Petrov I. R. and Kudritska T. E. - VESTN. KHIR. 1957, 78/5 (56-63 and 158) Graphs 2 Tables 3

It was found that after a 20-min. exclusion of coronary circulation cats under hypothermia recuperated all their functions, the organic phosphorus compounds being preserved in the brain tissue at normal levels, the quantity of inorganic phosphorus being slightly raised and lactic acid being present in great amounts (augmentation of glycolysis). Five, 12 and 30 min. after the restoration of normal circulation the latter was on a markedly high level, the interval of an hour bringing about its evident decrease and the appearance of normal levels of organic phosphorus compounds and inorganic phosphorus. Thus, at the end of the first hour the synthetic brain property associated with phosphorylation is obviously restored. After a period of from 2 to 3 hr. of normal circulation, when the body temperature increased to 30°-33°, the animal showing tremor and dyspnoea, with decreasing of phosphorus compounds. These symptoms of anoxia suggest the need of preventive measures in the course of rewarming to palliate the impending oxygen insufficiency.

EXCERPTA MEDICA Sec 9 Vol 13/6 Surgery June 59
3039. (887) THE USE OF AMINOPEPTID IN BLOOD LOSS. (EXPERIMENTAL
INVESTIGATION) (Russian text) - Kudritskaya T. E. and Shurygin
D. Ya. - VESTN. KHIR. 1958, 81/8 (54-58) Tables 2

Blood was withdrawn from the femoral artery of dog in quantities from 34 to 79% of the whole blood volume, this procedure being immediately followed by amino-peptid administration into the femoral vein. The volume of the injected solution was similar to that of the blood withdrawn. Readings of arterial blood pressure, respiration, length of the animal survival and the rate of blood restoration were the criteria studied. In cases of mean severity and, in some instances, of great blood loss, aminopeptid proved to be a reliable agent. It could not palliate a repeated second fall of blood pressure. The best response resulted from the administration of aminopeptid with a maximal concentration of protein and salts and a minimal percentage of amine nitrogen in relation to the whole nitrogen. The restoration of the blood indices corresponded to those of the control animals.

Meteorologiya i gidrologiya, 1959, Nr 1, pp 59-60 (USSR)

ABSTRACT:

Three instructions of the GOIN (Gosudarstvennyy Okeanograficheskiy Institut - State Oceanographic Institute) published almost simultaneously in 1957 are criticized. The author takes them to be superfluous, as sufficient and detailed instructions of the GUGK (Glavnoye Upravleniye Geodezii i Kartografii - Main Administration of Geodesy and Cartography) and service regulations of the GUGMS (Glavnoye Upravleniye Gidrometeorologicheskoy Sluzhby - Main Administration of Hydrometeorological Service), as well as numerous textbooks, are available. Besides, the instructions contain many inaccurate definitions and editorial faults.

The Plenary Session of the Interdepartmental Committee on Aerial Photography

PERIODICAL:

Izvestiya Akademii nauk SSSR, Seriya geograficheskaya, 1959, Nr 3, pp 150-151 (USSR)

ABSTRACT:

The plenary session of the Interdepartmental Committee on Aerial Photography of the Otdeleniye geologo-geograficheskikh nauk AN SSSR (the Division of Geology and Geography of the AS USSR) was held on Nov 17 and 18, 1958, in the Laboratoriya aerometodov AN SSSR (Laboratory of Aeromethods, AS USSR) in Leningrad. The following problems were discussed: mutual information on prospective work and on completed themes; organization of the keeping of aerial photographic materials serving as an intermediary stage in the cartographic process; the working out of a unified work plan to perfect methods used in interpreting aerial photography; coordination of research on the economy and organization of aerial geodetic work; organizational problems. The Committee

Card 1/4

SOV/10-59-3-29/2

The Plenary Session of the Interdepartmental Committee on Aerial Photography

published in 1958 a specialized bulletin under the title "Svodka materialov po razrabotke i ispol'zovaniyu aerometodov" (A Summary of Materials Concerning the Development and Use of Aerial Methods). This bulletin will be published yearly, near the first of September. It will include work plans of the respective institutions for the current, as well as the forthcoming year, yearly reports, reports on theoretical development, new apparatus and equipment, on the application of aerial methods in different branches of science and technology, and a respective bibliography. The Committee accepted a resolution according to which D.M. Kudritskiy (Leningradskiy gidrometeorologicheskii institut - Leningrad Hydrometeorological Institute), Ya.Ye. Zlatkin (TsNIIGAIK) and B.V. Troitskiy (GUK MVD USSR), members of the Committee, are to work out basic directives for the registration and storing of aerial photographic materials on a state scale. The depositories, as used by the Gosgeofond, the Kartgeofond and others will serve as examples. As far as the interpreting of aerial photographic materials are

Card 2/4

30V/10-59-3-29/32

The Plenary Session of the Interdepartmental Committee on Aerial Photography

concerned, the following tasks have been recommended to respective organizations for special attention: 1) wide development of the theory of aerial photography; 2) improvement of interpreting methods; 3) the generalizing and systematizing of the interpreted materials. The session requested the TsNIIGAIK, the NII VTS, the Laboratory of Aerial Methods, as well as the Department of Geography of the Moscow State University (MGU), to prepare typical samples of albums generalizing the most important interpreting materials, and to carry out the respective landscape districting of Soviet territory. The development of the general theory of aerial photography should be done in the Laboratory of Aeromethods, AS USSR. A special committee presided over by A.I. Sukhov (MIIGAIK) has been given the task of coordinating research on the economy and organization of Soviet aerial geodetic work. Respective regional conferences are to be summoned, and specialized bulletins published. The session

Card 3/4

SOV/10-59-3-29/32
The Plenary Session of the Interdepartmental Committee on Aerial Photography

recommended to the Geograficheskoye obshchestvo SSSR (USSR Geographical Society) to organize, in its regional branches committees on aerial photography and photogrammetry - along the lines of the Leningrad Committee. The following curators were appointed to assist the Inter-Departmental Committee on Aerial Photography in the corresponding sections: Yu.K. Yutsevich (air surveying photography), K.S. Lyalikov (aerial photography), D.S. Volosov (optics), G.B. Romanovskiy (photogrammetry), I.R. Zaitov (general questions of deciphering), G.A. Avsyuk (aerial geography), V.A. Bukhanevich (aerial geology), A.A. Logachev (aerial geophysics), G.G. Samoylovich (forestry), A.V. Glagolev (engineering investigations) and A.I. Sukhov (problems of economy and organization). There is 1 Soviet reference.

AUTHOR: Kudritskiy, D.M.

TITLE: The Interdepartmental Commission on Aerial Surveying

PERIODICAL: Izvestiya Akademii nauk SSSR, seriya geograficheskaya, 1960, No. 4,
pp. 138 - 142

TEXT: The regular plenary session of the Mezhdudovodstvennaya komissiya po aeros'yenke (Interdepartmental Commission on Aerial Surveying) held in Leningrad on December 10 - 11, 1959, devoted special attention to investigations connected with the development and application of aeromethods in the institutes of the AS USSR and in the academies of the associated republics. Reports were given by K.S. Lyalikov of the Laboratoriya aerometodov (Laboratory of Aeromethods), V.I. Avgeyevich of the Institut geografii (Institute of Geography), Ye.A. Galkina of the Botanicheskiy institut (Botanical Institute), N.V. Lebedeva of the Karelskiy filial AN SSSR (Karelian Branch of the AS USSR), I.V. Protas'yeva of the Institut merzlovedeniya (Permafrost Institute), A.P. Romadonov of the Institut geologicheskikh nauk AN USSR (Institute of Geological Sciences). It was ascertained that in the AS institutes application and development of aeromethods is

Card 1/3

The Interdepartmental Commission on Aerial Surveying 3/010/60/000/004/004/006/XX
A053/A026

conducted on a very limited scale. The reason for this deficiency is traceable to the Interdepartmental Commission of Aerial Surveying, which has failed to give aeromethods the necessary scientific backing and to work out procedures of their application. The plenary session determined the principal tasks of the Laboratory of Aeromethods in its capacity as highest authority in this branch of science. These tasks consist in the development and improvement of aeromethods in the light of latest technical and scientific achievements. A number of problems were also pointed out, on which it is necessary to combine the work of all institutes of the Academy. These problems comprise the establishment of a general theory of aerophotography and of evaluating aerial photographs as well as the complex development of aeromethods with a view to widening their range of application and to improving the effectiveness of landscape investigation. The conference also dealt with the problem of selecting and classifying material of aerial surveying for the Tsentral'naya aeros'yemoch'naya fil'moteka (Central Collection of Films (Filmothek) of Aerial Survey). The Laboratory of Aeromethods is to assume responsibility for all development work in connection with aeromethods, while the Interdepartmental Commission will be responsible for the coordination of the work pertaining to application of aeromethods by the AS institutes. A.I. Sukhov of the МИИГАиК (MIIGAIK) reported on the construction of geodetic,

Card 2/3

photogrammetric and aerial surveying instruments. G.V. Romanovskiy reported on the improvement in evaluating aerial photographs, in compliance with recommendations issued during previous sessions. Other speakers were D.M. Kudritskiy of the Leningradskiy gidrometeorologicheskii institut (Leningrad Hydrometeorological Institute) and P.Ya. Rayzer of the ЛКВВИА (LKVVIA). The Commission of the plenary session deemed it necessary to convene an All Union Conference for 1961 pertaining to theoretical and practical problems evaluating of aerial photographs, in which connection a committee was formed with the following members: G.G. Samoylovich, G.V. Romanovskiy, D.M. Kudritskiy, V.I. Avgeyevich, P.Ya. Rayzer, Ya. Ye. Zlatkin, V.A. Bukhanovich, V.P. Miroshnichenko, N.N. Sokolov and S.V. Belov.

KUDRITSKIY, A. G. MEDICA Sec. 16 Vol. 5/5 Cancer May 1953

Yu. K. 2204. *Skin cancer relapses following X-ray therapy (Russian text)* Kudritskiy Yu. K. Central Roentgen-Radiological Institute, Leningrad. *Vopr. Onkol.* 1953, 2 (177-182)

There were 21.4% relapses among 1,400 cases of skin cancer observed during a period of 30 yr. of experience with X-ray therapy. Approximately 75% of all the relapses occur during the first year following the treatment (with an equal distribution over all stages of the disease process), a majority of them (60%) being observed between 4 and 6 months. The second peak in incidence of the relapses occurs towards the end of the second or the beginning of the third year. Bearing these facts in mind, it is advisable to give special attention to the patients and even to give prophylactic X-ray therapy at the slightest suspicion of the possibility of relapses at periods when they most frequently occur, 4-6 months and 2 years after treatment. Three years should be the minimum period of observation following treatment; necessary to evaluate the effectiveness of the method of X-ray therapy used for skin cancer. The frequency of skin cancer relapses is really influenced neither by the site nor by the histological structure of the tumour. Observations have shown that radiotherapy of relapses following X-ray therapy of skin cancer can be quite successful. X-ray therapy of relapses is less effective. As a rule, repeated X-ray therapy of skin cancer relapses does not lead to a cure. X-ray therapy does not produce changes in the histological structure of the tumour.

Abstract: tion of irradiations and approached the degree observed in control animals after approximately 160 days. Before death (at the level of total doses of a 3000-r range the time fluctuations of the reflex again became larger. A decrease of fluctuations after repeated actions was noted in daily irradiations with 100 r each, every second day - 500 r each, as well as with 1200 r 2-3 weeks after preceeding irradiation with 300 r or in 3000 r 8-11 months after preceeding irradiation with 500 r. In the two latter cases, the preliminarily-irradiated animals lived somewhat longer than those which were subjected to only single irradiation. The effect of repeated irradiations was conditioned by the development of adaptive defensive reactions in the irradiated organism. -- E. B. Glikson.

TITLE: The Third Scientific-Industrial Conference on Radiation Hygiene

SOURCE: Meditsinskaya radiologiya, v. 9, no. 3, 1964, 84-89

TOPIC TAGS: radiation hygiene, radiation effect, ultraviolet radiation, dosimetric apparatus

ABSTRACT: The Leningrad Scientific Research Institute for Radiation Hygiene of the Ministry of Public Health, RSFSR, sponsored the Third Scientific-Industrial Conference on Radiation Hygiene in Leningrad, 16-20 April 1963. More than 650 representatives of Soviet scientific and industrial organizations participated in the conference. One hundred and fourteen papers on the basic problems of radiation hygiene were presented at the meetings. R. S. Mostova, T. A. Sviderskaya, and

Cord 1/4

ACCESSION NR: AP4025125

D. M. Tyukov, reporting on the action of various types of radiation energy, stated that ultraviolet radiation increases and infrared radiation decreases the resistance of the organism to the action of ionizing radiation. T. A. Sviderskaya established experimentally that determination of the activity of the SH-group and of alkali phosphatase in the blood is a very sensitive indicator of the effect of ionizing radiation on the organism of men and animals. Seventeen reports dealing with computer-dosimetric apparatus and radio-metric and radiochemical methods of investigation were presented. O. N. Chulkova discussed the functional status of the vestibular analyzer in white mice. She found that irradiation with small doses (25 r) reduced sensitivity to the rotation test from the 15th to the 40th day after exposure; a decrease in the radioresistance of the vestibular analyzer was observed after additional irradiation with doses of 200, 400, and 600 r. A. S. Orlov investigated the effect of preliminary irradiation of mice with small doses (25 r) of ionizing radiation on the content and biosynthesis of DNA in tissues subjected to repeated irradiation with doses of 400—1000 r at 14-day intervals. N. D. Bukhman and associates presented a paper on the change in the sensitivity of the organism to ionizing radiation in relation to

Card 2/4

ACCESSION NR: AP4025125

the content of B vitamins in the diet. It was shown that the prophylactic action of the combined use of B vitamins is effective only at certain doses. S. A. Keyzer reported on the relationship between the biological effect and doses in single exposures and in chronic irradiation with small and medium doses. He suggested a classification of the doses ranging from 0.001 to 200,000 rem. He designated doses below 100 rem as small doses. He also described the effect of four radiation levels, namely: 1) those close to background radiation, which do not cause noticeable somatic changes; 2) doses which cause some somatic changes; 3) doses which on chronic action cause chronic radiation sickness; and 4) doses which cause subacute radiation sickness. Yu. K. Kudritsky presented a paper on the determination of the highest permissible level of ionizing radiation and suggested a classification on the basis of adaptation of the organism to the effects of radiation.

CZECHOSLOVAKIA

Prague, Časopis Lékařů Českých, Vol CII, No 23, 31 May 63, pp 636-640.

the study was a 46 year old patient suffering from Cushing's syndrome caused by a benign adenoma of the adrenal and stenosing adenocarcinoma of the sigmoid. A preoperative diagnosis was confirmed by X-ray, biochemical tests, an operation, and biopsy. The patient died on the fifth day after operation with signs of peritonitis, retroperitoneal phlegmon and sepsis caused by *Bacterium coli*. Necropsy revealed an unusual chronic tuberculous process in the other adrenal. It is assumed that it was a case of coincidence of three frequent affections. It is the fifth case of coexistence of Cushing's syndrome described and the first case of coexistence of a hormonally active benign adenoma and TB of the adrenal with malignant neoplastic process in the gastrointestinal tract. Twenty-two references, including 3 Czech and 1 Slovak.

✓ Metabolism of benzene in man. J. Tešinger, V. Bergerová, J. Křivá, and J. Křivá (Charles Univ., Prague). *Prace Léč. 4: 440-446 (1972)*.—Human subjects inhaled benzene (I) in concn. of 340 γ/l . of air for 5 hrs. Between 33.3 and 60% (av. 45.3%) of inhaled I (385 mg.) was retained. During the decont. period, 3.9-27.8% (av. 13.1%, exceptionally 41.5%) of retained I was excreted through the lungs and 0.1-0.2% in the urine. Normal unexposed persons excreted in the urine 9.5 mg. of phenol (II) (including *p*-cresol) and 4.8 mg. of pyrocatechol (III) during 24 hrs. Hydroquinone (IV) usually did not appear in normal urine, provided no smoked meat or drugs had been consumed. Patholog. excretion of I, 0.7-42% (av. 23.8%, exceptionally 64.0%) of absorbed I was excreted in the urine in the form of II, 0-5.4% (av. 2.0%, exceptionally 10.4%) as III, and 0.1-0.3% (av. 1.1%) as IV. Excretion of II and III was highest during the first 24 hrs. and was completed within 48 hrs., while IV took over 48 hrs. The excretion of org. sulfates (V) in the urine of exposed subjects was increased as compared to inorg. V. Opinion is expressed that I affects the metabolism of protein substances, the metabolites of which are excreted in the urine in the form of glycerol sulfates. L. J. Urbánek.
